OK I understand that a Skylake Mobo works with OZ 167X. Does a Skylake Board works with a 7xxx / 8xxx (with Patched Bios for Coffee Lake) CPU? What is with a Kabylake Mothboard with a Skylake CPU? By the way, which Skylake works better, the DDR3 or the with DDR4? If Kabylake boards freezes on red screen, Have you tested that from the Bios or from the EFI? I have many Questions, but that is a interesting theme.

Sorry for my English.
