This was the SSDT's missing that i'm speaking for, without all stuffs and SSDT's and Injector.kext i've made, you'll not be able to reach desktop!

Every word i said in my guide is sensitive and important, if you miss only one step, it will stop at that point!

This is not a joke, because the ACPI tables in skylake mobos aren't the same as previous generation, there's a lot of \_DSM that makes problem!
