Erledigt OZMOSIS REQUEST THREAD / Ozmosis (Hilfe und Diskussion)

Beitrag von „griven" vom 11. Mai 2018, 00:06

@firefly_can_fly you're right there maybe differences across MB Revisions and so it's absolutely legit to request a new Build. I created two flavours of your requested rom. One has built in APFS Support (APFS Driver taken from the last available BETA) and the other one uses unsolid.kext to suppress APFS conversion of SSD drives. The APFS flavoured version lacks the hermit shell due to limited space of the ROM Image.

Both flavours carry the latest versions of FakeSMC and Sensors as well as IntelMausi.kext to support your onboard Lan Connector also both of them have an up to date defaults.plist build in. I'll attach the defaults.plist as well in case you'd like to customise it. You'll maybe preferable want to go with the Unsolid flavoured one since OZ still does not play well with APFS Containers.
