## Flashed Ozmosis: Boots into BIOS ok - Windows does not boot

Beitrag von „bazmattaz“ vom 17. Mai 2018, 22:53

Zitat

do you use a Defaults.plist containing the SMBIOS-Infos? Does that contain all the necessary entries and newest ROM-data which have to be used for High Sierra?

I built a USB with Unibeast tool from another site and then opened the config.plist with Clover Configurator and set a SMBios with Clover. I can send a screenshot if you need.

BUT - surely Ozmosis doesn't need a clover config??
