I get 3793 points in Geekbench Compute 4. As there was no real Mac with this particular card, I think the macOS driver was built by apple, but later they decided mot to include this GPU in a Mac, so they didn't spent time to optimise the driver. Years ago, I had a Core 2 Duo notebook with a ATI HD 4570. This card was working, but the driver crashed as soon as I started a OpenGL application on it. This card also was never included in a Mac.
