HI

I have asus gl553vd = I7 7700HQ - HD 630 (installed) + GTX 1050 Desktop model (i love to off full !!!) + mac os 10.13.6

i fix many things (touchpad model elan 1200 . hd 630 . screen light . lan . usb .speaker)

i have so necessary problem ! my cpu love to eat many power on battery and AC (go to 120W) and buttery work only for 2H and so bad for buttery working . i checked full and i found MR GPU (GTX 1050) is on and use power for off them i used graphics_REG-disable patch for DSDT after patch system boot and i was login to mac os next , after 25S fas speed go to max level (6000) but cpu work amazing only use 2W power !!!!!!! and battery work for 5H .

i get to file report , befor and after patching .

how can i fix speed fan ??
