`Erledigt` Ozmsis bootloader crash when ctrl or shift key pressed on laptop

Beitrag von „1and1get2" vom 7. Juli 2018, 11:57

sorry but I don't speak a word of German, so hopefully, you'll excuse my English.

I've been trying to use clover through dbounce and rEFind separately
, however with no luck yet.the results are the same in both cases.

Computer: CP65S Sager NP8650 / Clevo P650SA/SE, i7 4720HQ (with HD4600) + HM87 chipset, AMI Bios, (mega: [mod](#))
what I've done:
I replaced FileSystem with enhancedFat from rom, driver added dbounce and in dbounce.plist added apfs hfs and ozmosis driver per guide
however, when booted, I was able to see ozmosis boot selection screen, but not apple partition, and most importantly, whenever I press shift or ctrl key, the whole system becomes unresponsive instantly. (freeze and not response num lock and cap lock key)

My laptop internal keyboard is connected through p/s port, I did played around keyboard driver (aptioinputfix / usbkbdex) and still no luck

I understand not many laptop users are using ozmosis, but I just wanted to give it a try.
