## [gelöst] Acer Spin 5: Finetuning !

Beitrag von „MrVanosh“ vom 5. August 2018, 15:48

[@iPhoneTruth](#) you checked touchpad works on Windows or linux? I have too Acer Spin 5 but with i5-6200u and I can help something. Maybe you factory rested bios and you must change Touchpad from Advanced to basic or reverse. I used touchpad with appleps2smarttouchpad too and it works well when I have advanced option in bios and no Windows patch. Touchscreen is weird it works for me on 10.12.0 and never worked OOTB on newer version but I have UPDD Driver and with that it works well with 10 points multi touch. Touchscreen is Raydium Touch System on USB. I've tried to make touchpad works with VoodooI2C but I2C transaction error and other errors occurs when make GPIO Pinning. You can write in German google translate translates it really well.

Edit: Yey I make GPIO Pinning successfully. Default in DSDT i2c address is 0x002C which is wrong, right value is 0x0015. Touchpad is detected by VoodooI2CELAN but not works with it, must use VoodooI2CHID.
