[gelöst] Acer Spin 5: Finetuning !

Beitrag von „MrVanosh“ vom 8. August 2018, 21:05

OK, there is my DSDT.dsl. You can copy whole TPD0 device section, I look into you DSDT and this section is the same as on my origin DSDT so you can simply copy and paste it. I recommend use my version of VoodooI2C & VoodooI2CHID too, it have better gestures because it's detected like Magic Trackpad and gestures can be set from system preferences which is not possible on original Voodoo. It supports Mojave too. My DSDT is not same like you so don't use it because I have modded bios which have a lot of options and I changed [DVMT](#) Size, I undervolted CPU and IGPU and I change some other options that I don't remember. If you have any questions or need help ask, I have perfect hack on this laptop 😊

Now I'm trying to make MSFT1234 (acceleration sensor) to work and maybe we will have auto rotation too 😊

I may won't respond within 2 days because I'm going back from Germany to my country.
