Erledigt macOS Mojave Ozmosis BETA – OZ167X-XMAX

Beitrag von „kuckkuck" vom 14. August 2018, 15:02

@diy2018 First of all please try to write in German or English since not a lot of people understand Chinese here...

Also please enter your hardware details into your profile so that I know what you're using.
I'm guessing that you are having a problem booting Mojave, when the HD4600 is enabled. Are you also using a dedicated GPU? If yes, disable your iGPU and try to boot.

I had those issues too and was able to boot Mojave with both HD4600 and R9 280x after resetting my BIOS settings to defaults. I also heard of somebody who was able to do it with dvmt set to 128m. If the iGPU works as a secondary GPU it should be used with a connectorless ig-platform-id i.g. 0x04120004...

@nrchandar0100 Which processor are you using? Do you have a working Ozm BIOS at the moment?
