macOS Mojave Ozmosis BETA – OZ167X-XMAX

Beitrag von „kuckkuck“ vom 14. August 2018, 16:24

Regarding the Chinese language, I was talking to [@diy2018](#) 😊

I created a ROM for your GA-Z97-D3H.

It contains the following files:

```
HfsPlus
APFSDriverLoader
EnhancedFat
Ozmosis
OzmosisDefaults
KernextPatcher
OzmosisHFTheme
FakeSMC.Rev-6.26-344-g1cf53906.1787
IntelMausiEthernet.Rev-2.3.0
```

The Ozmosis Version ist version Oz167x-XMAX and compatible with Mojave when used with the Kernextpatcher that is also in the ROM.

The defaults.plist ist also compatible to macOS Mojave.

FakeSMC and IntelMausi for correct Boot and LAN are installed in the BIOS, too.

Please report if it is working. Cheers!

Edit:

By your guide what i have understood is i have to download 167-x mass and insert every ffs files you have provided by mm tool. am i correct ?

Not every file provided, just the necessary ones (compare to listing above) and also I normally use UEFITool.
