i checked - it's not take it effect, may be use the FBPatcher...

Thanks for checking! So you deleted the Mojave iGPU driver and correctly installed the one from High Sierra? And nothing changed?

That would mean that the driver itself and the changes made to it isn't the issue here.

So this could be very much something related to the kernel... I think I'm gonna make an experiment regarding MSR.

This does not have to be an error in the Ozmosis bootloader. This can also be an issue about incompatibility between WinTel UEFIs and Apples Firmware, locked registers in our UEFIs or a bug somewhere else. I can't tell at the moment...
