my graphics card is GT-710

In your profile it says GT 210. Please enter your real hardware specs into your profile... When you booted Mojave with Clover on that system, how did you setup your GPU? Did you use the Nvidia WebDrivers, InjectNvidia or something like NvidiaGraphicsFixUp? Is your Nvidia GPU set as primary in the BIOS?

[Zitat von ShadIK02](#)

can it be easier to come up with something like a converter for Clover to run it from the BIOS? What do you think?

That is not the point. Although you could run Clover from the BIOS, why would you? I don't play around with FV because I can and this is also not about running something out of the BIOS.

When I setup my first Hackintosh I used Ozmosis. Throughout the years I started to love the way it works and it's benefits. I don't want to use Clover. I know what I have from using Ozmosis. Getting involved with the actual functionality of Oz you will realise even more in which ways Ozmosis is ahead of Clover.

Inserting Ozmosis into my ROM is the best way to load Oz for me at the moment. My system works flawless and I enjoy and appreciate the benefits of Ozmosis. I just created this topic to keep Ozmosis alive in peoples heads, help others who can appreciate Ozmosis, too and to learn even more by solving problems that others face. (A lot of "Ozmosis" in one paragraph 😄)
