## **macOS Mojave Ozmosis BETA – OZ167X-XMAX**

**Beitrag von „kuckkuck“ vom 17. August 2018, 16:24**

You can navigate to different partitions within the shell by typing e.g `fs0:`, `fs1:` or `blk1:` etc. When you type `ls` the content of your current directory will be shown.

You can navigate through folders by typing `cd foldername` so e.g `cd System\Library\CoreServices` will get you to where the `boot.efi` is located.

So select your Mojave installation on the M.2 using e.g `fs5:`, navigate to `System\Library\CoreServices` and then type `bcfg boot add 0 boot.efi "Mojave"` to create a new boot option for that `boot.efi`.
