macOS Mojave Ozmosis BETA – OZ167X-XMAX

Beitrag von „kuckkuck“ vom 19. August 2018, 15:59

Extract your DSDT and please generate a defaults.plist for your System...

Mojave is a beta and the idea behind this thread isn't to get Mojave fully working on systems of anybody. I presented a way of installing Mojave on a System using Ozmosis and published my work so that others can test it.

The purpose of this thread is not to walk you through the complete Post-Install, sorry. This is about testing and developing.

Also unfortunately nobody can do something about Nvidia Drivers that don't exist.
