## macOS Mojave Ozmosis BETA – OZ167X-XMAX

Beitrag von „kuckkuck“ vom 20. August 2018, 21:34

[Zitat von ShadIK02](#)

I'm not using the AcpiPatcher, how can i refuse KernnextPatcher?

Previously, it was not use it, please explain his principec of his work)

Every Bootloader that can start macOS needs to patch the Kernel in order to Inject Kexts properly...

To make Ozmosis compatible to macOS Mojave, I didn't implement the KernelPatches necessary for Mojave into Ozmosis itself but entered them into the KernnextPatcher. With this setup the KernnextPatcher (and not Ozmosis) executes the necessary KernelPatches for Mojave KextInjection. Without the KernnextPatcher, injecting Kexts from the EFI will not work.

That's why you have to use the provided KernnextPatcher and Ozmosis to use Mojave properly. There's although nothing bad about putting the KernnextPatcher into your BIOS.
