For audio to work with new AppleALC 1.3.0 its needed to delete FirmwareVendor key from Defaults.plist.

Right!

Folgender Eintrag muss von der defaults entfernt werden:

Code

1. ...
2. `<key>FirmwareVendor</key>`
3. `<string>Apple</string>`
4. ...

It stalls and nothing happens. Guess we have to wait new webdriver.

I don't think that this is a WebDriver issue since people that use AMD cards can face the same issue...

Have you tried this?

For me it works just normal... I can't say what the problem is and why Mojave refuses to boot for some people when iGPU and dedicated GPU are activated.

I had that problem in the beginning and the only way I could start Mojave with both GPUs, was when I had Mojave as the first boot priority, entered the BIOS and exited it again without saving (the behaviour doesn't make sence to me).

Then I reset my BIOS to defaults and ever since that day I can start Mojave completely normal with both GPUs activated.

I'm currently also working on implementing all patches into Ozmosis.efi to make it work with

the old way again. It's hard but maybe I will be successful. I can't tell if this will have any impact though...
