iGPU richtig aktivieren - Intel Core i7-8700k

Beitrag von „kuckkuck“ vom 26. August 2018, 15:18

Das liegt sogar an Mojave:

Zitat

Mojave, Lilu + WhateverGreenYou cannot use the KextsToPatch for framebuffer patching in Clover for Mojave. You must use Lilu + WhateverGreen with the -igfxdump boot flag to generate a framebuffer binary dump in the root of your boot drive. The output will be in /AppleIntelFramebuffer_GEN_KERNX_Y on your boot drive (Eg. AppleIntelFramebuffer_10_17.7). You can then use Intel FB-Patcher to File->Open this and view the framebuffer data. You can then use it to generate a config.plist/Devices/Properties patch for your platform id. For more information please read the guide below.
