[gelöst] Acer Spin 5: Finetuning !

Beitrag von „MrVanosh“ vom 19. September 2018, 19:20

[@iPhoneTruth](#) Yeey, now we can use touchscreen with VoodooI2C only, UPDD Driver is not needed now. Download VoodooI2C 2.1 from github site. It has native gestures (emulated magic trackpad 2) like on my previous version which I uploaded there. If you want to use it, please remove my CustomUUID from your clover config.plist. Before installing VoodooI2C remove UPDD (can be uninstalled by going to / Applications / Utilities / UPDD Uninstall) If you want Mojave version (next from github don't have support for Mojave and make kernel panic write here I will post fixed version)

Edit: meh touchscreen in this version works, but when laptop going to sleep kernel panic occurs because of screen. So again we are bounded to UPDD Driver. I think this may happen because of that USB is disconnecting when going to sleep, I will try to change something in my DSDT to change this behaviour and I will post result. Now if you want use VoodooI2C 2.1 with UPDD you must replace Info.plist in VoodooI2CHID to this <https://pastebin.com/xNYLYT0n> to make VoodooI2C not attach to touchscreen when using UPDD (otherwise it will cause kernel panic)

Edit: Oh 😄 Touchscreen on Mojave works without UPDD and voodoo 😄 Gestures not work and right click etc. But it don't cause any troubles. So there is another option. If you want use this u must replace Info.plist in VoodooI2CHID like I said before.
