macOS Mojave Ozmosis BETA – OZ167X-XMAX

Beitrag von „taoarch“ vom 29. September 2018, 06:08

[@Download-Fritz](#) Excuse me how to "disable Oz' AF via "-norelocate" and load AptioMemoryFix instead"?

I put

```
" <key>norelocate</key>
```

```
<true/>"
```

under Defaults:1F8E0C02-58A9-4E34-AE22-2B63745FA101 or Defaults:7C436110-AB2A-4BBB-A880-FE41995C9F82

in ozmosisdefaults.plist ,then covert it and aptiomemoryfix.efi to ffs,insert them to bios ,but it doesn't work at all!

thx
