Thanks for your guidance.. System boots with the EFI (Post1) and "config\_i5\_2520m\_mit\_der\_HD6470M.zip", GPU recognized correctly, however I am still dealing with the same issue of no proper shutdown. System reboots, then issues crash report . I have deleted EmuVariable as well as cleared nvram, with no positive results. Incidentally, System Profiler is not showing USB3.0 at all. USB2.0 is the only protocol displayed. Is that "normal" using the mentioned EFI/Config combination? Any additional suggestions would be much appreciated. Thank you very much!
