

Back / Forward Fix für 3. Party Mäuse unter macOS

Beitrag von „revunix“ vom 1. November 2018, 12:31

Hey,

habe da gerade was nettes gefunden, betrifft eigentlich nur Leute die Mäuse benutzen die nicht richtig unter macOS funktionieren. Mit dem hier besagten Tool funktionieren dann auch wieder die Vor/Zurück Tasten für den Browser und Finder.

Zitat

macOS mostly ignores the M4/M5 mouse buttons, commonly used for navigation. Third-party apps can bind them to ⌘+[and ⌘+], but this only works in a small number of apps and feels janky. With this tool, your side buttons will simulate 3-finger swipes, allowing you to navigate almost any window with a history. As seen in the Logitech MX Master!

Extensive information on this tweak can be found here: <http://sensible-side-buttons.archagon.net>

To ensure SensibleSideButtons opens whenever you start your computer:

1. Go to System Preferences
2. Click Users & Groups
3. Click your username in the left panel
4. Click Login Items at the top
5. Click the plus button at the bottom
6. Go to wherever you put the app (probably your Applications folder) and double-click it
