

Anleitung: USB 3.0 Mojave / (High-) Sierra / El Capitan für jedermann (zukunftsicher für Updates & komplett gepatcht)

Beitrag von „arminmacx“ vom 12. November 2018, 22:11

Hello everone,

USB2 & 3 on my hackintosh but after last 2 update of high sierra and latest mojave 10.14 & 10.14.1 my system start to reboot suddenly after a few hours my USB3 hard disk attached to my hackintosh. I checked it and I'm sure it's something wrong with USB3 because it rebooted my USB3 did not recognize by macOS and system works normally without restarting. I have not got any problem with it until I release the OS and I thought it would not be possible to fix it. I have usbinjecall.kext in my clover kext folder and i exclude the port as instruction. i have dsdt.aml in my clover too which is patched for my board z97x-u3d-bk rev1.2

BTW i have one USB3 hub which all my usb devices connect to that then connect to my mainboard and my mouse and keyboard connect directly to mainboard.

i need more thing just tell me and i provide what you need
