

Erledigt Richtige Config des Systems?

Beitrag von „rubenszy“ vom 20. November 2018, 18:04

Damit kannst du eher überprüfen wie dein CPU taktet, IPG glaube ich einiges aber nicht das es korrekt die Werte ausliest oder HWMonitor ist eher ein Tool für Temperaturen.

https://sourceforge.net/project/showfiles.php?group_id=1462&file_id=184

The screenshot shows the HWMonitor application window. It displays various system metrics in a tree view. The 'CPU' section is expanded, showing 'Max Temperature' at 50°C, 'Current Temperature' at 35°C, 'Voltage' at 1.100 V, and 'Power' at 1.000 W. The 'GPU' section is also expanded, showing 'Max Temperature' at 50°C, 'Current Temperature' at 35°C, 'Voltage' at 1.100 V, and 'Power' at 1.000 W. Other sections like 'RAM' and 'Motherboard' are partially visible.

Category	Item	Value
CPU	Max Temperature	50°C
	Current Temperature	35°C
	Voltage	1.100 V
	Power	1.000 W
GPU	Max Temperature	50°C
	Current Temperature	35°C
	Voltage	1.100 V
	Power	1.000 W
RAM	Max Temperature	50°C
	Current Temperature	35°C
Motherboard	Max Temperature	50°C
	Current Temperature	35°C
