Hackintosh läuft aber kleine Probleme

Beitrag von „Dnl“ vom 7. Dezember 2018, 19:58

Hast du dir auch mal alles durchgelesen dort? Die Antwort steht ja quasi dort schon. Da braucht man meiner Meinung nach nicht mehr viel herumexperimentieren.

"This does NOT enable hardware acceleration."

Zitat

It is still uncertain when will NVIDIA release any Web Drivers for macOS Mojave, but we can try a workaround.

A few Important Notes

- This may not work for everyone.
- What this will do is force the system to install the High Sierra official NVIDIA Web Drivers and patch them so both the Web Drivers and CUDA drivers recognize your graphics card.
- This does NOT enable hardware acceleration. Although there have been a few successful reports for older graphic cards, cards like my 1050-ti simply do not work well in Mojave without the Metal acceleration. The only way to resolve that, is to get the official Web Drivers.
- I honestly don't recommend this route if you use your computer for video editing. You need the Metal or CUDA acceleration, and so far, any attempt to do that has failed.
