The t450 and t450s no longer have whitelists. You can swap out whatever parts you need and they'll work fine. I've already put a dell wifi card and a display that's from a 3rd party in my T450 no problem. I've also installed Mojave on it as well and it runs beautifully. Heres my guide that I made.

If you have trouble with installing anything make sure you've updated the bios to the latest version as whitelisting was removed a few updates back.

just search google for jsassu20 Mojave hackintosh and you'll find my guide. It won't allow me to post the link here.
