I've tried all this on my system now ...

ig-platform-id 0x04120004 + Inject Intel ...

I then changed the SMBIOS to iMac 15.1 and come to about 23sec in Bruce X.

However, I'm surprised that in the Intel PowerGadget tool, the clock of the iGPU is constantly running at 1.25GHz. Is that all so ok?

Alles anzeigen

Currently having the same issue as you with iGPU running at 1.25Ghz. "Similar setup"

Have you been able to fix it?

I've tried multiple SMBIOS. Mainly iMac 14.2 and 15.1

PlatformIDs have tried 0x04120004 and 0x0412000B.

CPU PM Set via PluginType = True via config.plist

Using inject intel = true and shikigva = 60 boot arg

Tried using inject ATI = true with FB Orinoco VideoPorts set to = 5

also have a dAGPM.kext created in Clover / Kexts / Other

None seem to make a difference. iGPU runs at 1.25GHz.

["BIOS Settings"](#)

I have iGPU multimonitor set to Enabled in BIOS, shared memory at 256MB

VD-T disabled

All CPU settings set to AUTO. - No overclocking.
