AORUS PRO Z390, i9 9900K, Radeon Vega56 - Reboot nach dem erstem Login nach der Installation

Beitrag von „Beppo68“ vom 12. Januar 2019, 18:47

So, I've done a Load Optimized Defaults... Than I had to change:

Legacy USB Support from Enabled to Auto

USB XHCI Hand-off from Disabled to Enabled

VT-d from Enabled to Disabeld

and Wake on LAN enable from Enabled to Disabled

Everything else was ok. I'm running BIOS version 7.

I've done a reboot, and same result as before... after the apple log... no login screen -> reboot....

Then I've changed the USB-Port of the booting USB-Stick... It was in one of the 4 USB-Ports at the top... Now I can login and I was even able to compute a Geekbench: 6361 Single Core and 35135 Multi-Core...

I have changed the usb port several times, but without success

May this was a major step.

Your EFI was very different from all others.

You use iMacPro 1,1... all the other configs I've testet used iMac18,3 oder macMini 8,1

and instead of AptioMemoryFix-64, you use OsxAptioFix2Drv-free2000.

I will use this config as an starting point...

Thank you very much.

My Vega is still very loud, and very fast at 65° or 70° without anything todo...
