AORUS PRO Z390, i9 9900K, Radeon Vega56 - Reboot nach dem erstem Login nach der Installation

Beitrag von „nhasan77“ vom 12. Januar 2019, 19:30

I use iMacPro1,1 because the GPU is more closer to the original configuration. Also that is based on 8 cores. But the main issue I had with iMac18,3 was that none of my images would open with Preview. There were two solutions one was to fiddle with the BIOS or use iMacPro1,1. I chose iMac Pro and did not see any issue. The Geekbench score was similar to yours.

With AptioMemoryFix-64 I had the runtime error issue which was fixed by OsxAptioFix2Drv-free200 and I don't have boot issues anymore.

The only problem I now have is iMessage that does not work. I have tried many things but that did not help. This does not bother me too much.

My next step is to add thunderbolt so that I can use my two displays. I am using ASUS USB-BT400 Bluetooth USB but may look for a PCI card for the wifi and bluetooth.

btw, my BIOS version is F8.
