I have same issues with NUC8i5. Graphic card is detected right, vendor-id is defined same as macbook pro 15,2 but my HDMI output colors are very over-whited. I dont know how to fix that.

[Patricksworld](#) i follows yours and Rehabman tutorial and clover settings but i dont know how to "calibrate" Iris 655 HDMI output. Is it something different between NUC8i7 and NUC8i5 just than clock performance?
