

Radeon VII im Hackintosh

Beitrag von „Gigamaxx“ vom 15. Februar 2019, 01:10

Radeon VII in Mojave DP 14.4 #2. Metal! Edit AMDRadeon5000kext info.plist for ID. Does not work in 14.3 no acceleration.

Strange thing, Luxmark has a green background with single card. With dual cards blue (normal) but one card has [bios update](#) from Crimson 19.2 drivers so 1 card UEFI bios other Legacy bios?

Luxmark before Crimson 19.2 update Legacy bios.

Luxmark with 2x cards one UEFI other Legacy. Color is normal and no errors.
