

Radeon VII im Hackintosh

Beitrag von „CMMChris“ vom 15. Februar 2019, 14:38

[Gigamaxx](#) Great to hear that. Hopefully will stay like that with full support.

Any chance you can also test idle power consumption on the power socket compared to Windows? Vega 64 performs really bad with regards to this. With Dual Vega 64 my machine consumes about 60 watts idle under Windows and 120 watts idle under macOS which explains the high idle temps of the Vega cards under macOS.

When I remove both Vega cards and use the iGPU my idle consumption goes down to 30 watts under Windows and 21 watts on macOS.
