[Hier steht folgendes zu WhatEverGreen.kext](#)

### Zitat

Installing WhatEverGreen will take care of renaming all of the required ACPI identities for us so if you have any of the following Clover ACPI Fixes/Renames in your config.plist you should remove or disable them:-

- Change/Rename GFX0 to IGPU
- Change/Rename PEG0 to GFX0
- Change/Rename HECI to IMEI

The above Clover ACPI Fixes/Renames use a global/generic method of renaming the ACPI identities in the DSDT that can cause problems for us later on. WhatEverGreen finds the DSDT code that requires new ACPI identities using device specific identifiers and thus does a much better job.

Die Einträge sind jedoch in der Config.plist des Installations-Sticks. Macht das Sinn?
