I've just updated it and looks like everything is working better!

- Battery status looks more real than before (have to test a little more)
- Touchpad working (like before)
- Fans are not working all the time (had that problem)
- Audio working (also like before update)

I don't see any Nvidia in the System Report tab, is that ok?

I'll try the HDMI port in a minute, also sleep.

I'm also testing how it works with Final Cut Pro, not so fluently but working ok!

Thank you very much!!

EDIT:

Sleep working good.

HDMI: No panic when connecting cable, but no output options or any signal on screen. Did you install something else for it to work?

When booting I can see many times:

- PropertyInjector No props
- AsusNBFN: Cannot find the method ALSS (Brightness keys not working)

Alles anzeigen

for long time using battery check Activity Monitor app which app use power in background

yes. touchpad now working 100000000% !!! with all of Mac OS gestures.

fan working good you can't see it because for working fan need 40C . but now your cpu Temp is 30 to 40C !!!

HD630 + 2GB ram is powerful for Mac OS you doesn't need Nvidia .

I see sleeping work but you most use it !!! because when you use it gtx go to be turn on and use power .

I don't test HDMI . need debug .

but how do you install appleHDA ???

now we are workin on FN keys .

I don't now why booting long need debug ...

How do I know that my discrete graphic card is completely off ? My battery is still draining so fast.

Furthermore, sleep is not working correctly

I checked your IMg . your GTX is off . because I can see 2W using by cpu .

I see sleeping work but you most use it !!! because when you use it gtx go to be turn on and use power .

for long time using battery check Activity Monitor app which app use power in background
