What do you tink about TINU so far?

Beitrag von „ITzTravellnTime“ vom 25. März 2019, 10:02

Maybe i can add a feature to auto partition the usb drive into as many installer-ready partition as possible, but making some bulk or automated stuff would require heavy mods to the app, so i don't think i will do it soon, but i think that a viable solution for the actual app could be to have an auto partition feature to add as many installer ready partition as possible or as you want, and then you can put the installers yourself in the partitions using tinu multiple times, but i was thinking about redesigning the drive select screen and the installer app select screen for tinu 3.0 and so maybe adding a multiselect feature for the installer app and an auto format based on how many installers you selected could be good, but this would require also partially reworking the installer creation code to work multiple times and to have the format process as a separated and more advanced thing, so there will be a lot of work required, but i can do it.

And also an installer requires a 7gb partition, so i can optimize it a bit for larger drives and maybe being able to squeeze more installer partitions, consider also some space needed for indexing and the efi partition, so a good algorithm can get the best out of the space you have, the challenge is to implement this within an app since i have to gather all the needed info and then create an optimized autoformat shell script i can run in tinu, since it uses shell scripts (this is for reliability reasons, and you can also take a look at that in the source code)

In the meanwhile i am working on version 2.1.1 and so if you have some issues you want to be fixed, please tell me now.
