> Also ich weiß nicht was TINU tut, aber Mal angenommen, der macht nicht mehr als createinstallmedia...

Hi am the developer of TINU

TINU does basically 4 things: checks the usb driver and if it does not use guid, it formats it hfs+ with the guid partition table, so in that case you loose the entire data stored on the drive, for usb drives which are already in guid, tinu does just format the selected partition to hfs+. The second step is the createinstallmedia phase which is just launching the creatyeinstallmedia process with the right parameters for the installer appm version and the usb drive/partition and then wait for it to end. The third step is to check the createinstallmedia activity one it has ened (because tinu can't read the output of that process while it's running) and to check is everything has worked as expected. the 4th step is to apply the settings from the advanced options section of the app, which inludes an automatic efi folder installer (basically just select the efi folder and tinu can put it in the efi partition for you).

But the app is open source at: https://github.com/ITzTravelInTime/TINU
