The BIOS-Version doesnt matter. I updated my BIOS after installation twice, so its not a problem. It depends on which Radeon 590 you use because i heard some might cause some troubles. If you want to be sure its working, take one from Sapphire.

You can use my DSDT. The DSDT is just for fixing a crash. I dont know about version 10.14.4 of macOS though, it seems to cause many troubles. Many people have problems with that version.
