## **macOS Mojave Ozmosis BETA – OZ167X-XMAX**

**Beitrag von „witjojo“ vom 15. April 2019, 02:38**

I started the installation (Pic 1).

The installation starts after the restart (Pic 2).

After a few seconds come messages (Pic 3) and than a reboot.

Now he should start from "Installer (10.14.4)". But it comes only a black screen and nothing happens. No activity on the SSD.

When I select again from bios boot menu "Installer (10.14.4)" (Pic 4) a black screen appears again and nothing happens.

I don't think it has anything to do with iGPU settings.
