The Clover team recommends these steps:

Only use EFI/kexts/OS X folder during OS X installation. After this, install all the kexts in S/L/E. And delete the kexts inside EFI folder.

I use in this way, and i can confirm. Is better

PS: Don't forget to repair the disk permissions and rebuild the cache.

Alles anzeigen

Because thats where kexts belong! It's nice to be able to use kexts from /Extra, kexts folders or even in firmware, but thats not how they are intended to be loaded..

Das war so das, was ich gelesen habe. Danke da gehen die Meinungen wohl auseinander. Kann euch ja mitteilen welche ich installiert habe:

-FakeSMC

-Lilu

-WhateverGreen

-AppleALC

-IntelMausiEthernet

(alle auf der neusten Version)

MfG
