macOS Mojave Ozmosis BETA – OZ167X-XMAX

Beitrag von „Macintosh Healer“ vom 9. Juni 2019, 00:10

[nikoZ](#) The files are numbered, use the first 3 files to replace Filesystem.fff

put the rest in the same order in the end of your volume where you usually put Ozmosis files.

Edit the OzmosisDefaults.plist to change the S/N and BaseBoardSerial - I modified my own, I don't know if they would even be recognised by the OS...

I don't use devprop.fff

Be sure to properly edit your DSDT to have HD4600 working!

If you still get black screen right after selecting the boot volume, it might be the wrong OsxAptioFix driver for your mobo.

I did post a question on insanely Ozmosis thread to find out how to use other versions of OsxAptioFix...
