Lynnfield CPU + Gigabyte Mainboard-10 Jahre alt

Beitrag von „deevdedee“ vom 18. Juli 2019, 14:42

Sorry I'm responding in English. I have an H55 socket 1156 Motherboard with Xeon X3450 (overclocked) running Mojave 10.14.5 almost perfectly except for sleep. It may be because of the S3 / S1 issue discussed in this thread. I will have to try changing S3 to S1.

The trick for CPU Power Management is to remove NullCPUPowerManagement.kext, disable all CLOVER CPU options (don't Enable C or Enable P States), set MacModel to MacPro 5,1 and inject LPC.IOName = "3b09" in DSDT.

You can see my system if you Google "Mojave on Biostar TH55HD"
