

# OpenCore EFI Maker

Beitrag von „DSM2“ vom 18. August 2019, 09:20

Es gab seit Mai reichlich Updates zum Script...

Hier mal die ganz aktuelle Version 1.1.6

Edit:

```
OpenCore EFI Maker v1.1.6
Usage: ./OpenCoreEFIMaker.sh [options]
Options:
  -h, --help            display this help message
  -v, --verbose         enable verbose logging
  -i, --input <dir>    input directory (default: /)
  -o, --output <dir>   output directory (default: /)
  -s, --signature <key> signature key (default: None)
  -k, --key <key>      signature key (default: None)
  -c, --config <file>  configuration file (default: None)
  -m, --mode <mode>   boot mode (default: Legacy)
  -n, --no-secureboot  disable Secure Boot support
  -p, --partition <part> partition name (default: /)
  -q, --quiet          suppress progress messages
  -t, --test           test the configuration
  -u, --update         update the configuration
  -w, --wipe           wipe the EFI partition
  -y, --yes            assume yes to all questions

Example: ./OpenCoreEFIMaker.sh -i / -o / -s None -k None -c None -m Legacy -p / -q
Example: ./OpenCoreEFIMaker.sh -i / -o / -s None -k None -c None -m Legacy -p / -q -y
```
