Fix the Unknown Processor Info in "About The Mac":

1. Navigate to Hard Drive > System > Library > PrivateFrameworks >

AppleSystemInfo.framework > Versions > A > Resources > de.lproj

2. Inside de.lproj locate the file AppleSystemInfo.strings and copy it to your desktop.

3. Open AppleSystemInfo.strings in a in a text editor (BBedit TextWrangler)

4. You will see the following code:

```
<key>UnknownCPUKind</key>
```

```
<string>Unbekannt</string>
```

```
<key>UnknownComputerModel</key>
```

```
<string>Unbekannt</string>
```

5. Under UnknownCPUKind, in the <string> line with the string tags only, replace Unbekannt with your desired text. I replaced Unknown with zB. i5 9600K . Then I saved the file. (But you can enter anything you wish here.)

6. Copy AppleSystemInfo.strings from your desktop back into the de.lproj folder.

7. Reboot your computer to see this change.
