

Two things needs to be taken care of to boot macOS catalina: - If you have an EC device with type 'PNP0C09' in your DSDT then your macOS might get stuck while booting at initial stage. To bypass that you need to make sure EC device is disabled by making it return status Zero. You can create a custom SSDT to do that . Refer here : <https://github.com/acidanthera...piSamples/SSDT-EC.dsl#L33>

Nur zum laufen habe ich die Lösung noch nicht gebracht.
