WLAN card is exchanged as with any device but otherwise everything works.

In bios you could set a lot but most of it is not relevant to macOS.

I just put the Intel SGX on Disable and graphics on Intel HD. ACHI is important too.

The Clover folder was compiled with the help of al6042 and given. The serial number is already changed.

Until then it was a little cramp for me to install the thing. I hope you have it easier

```
[Attach = '99953', 'none', 'true'] [/ attach]
```

I have Dell OptiPlex 3060 SFF XCTO-i5-8500,16GB DDR4 RAM,512GB SSD.
Please suggest me step by step process to install Mojave or catlina Mac OSX.
Thanks in advance.
