

Gigabyte Z390 DESIGNARE: fertiger Clover-EFI-Ordner zum Download

Beitrag von „JimSalabim“ vom 18. November 2019, 18:17

[Mak73](#) You can use my folder from the first post here, it should work fine. Please use the iMacPro1,1 folder.

But add this to the Boot Arguments in the config.plist (just below "darkwake=10"):

agdpmod=pikera

If it doesn't work, please press F11 in the Clover boot menu and wait until the machine has restarted, then try again.

And please note that it can take several minutes until the macOS Installation program appears. Before that you see just the apple.
