

# Gigabyte Z390 DESIGNARE: fertiger Clover-EFI-Ordner zum Download

Beitrag von „JimSalabim“ vom 19. November 2019, 00:46

[Mak73](#) If adding "agdpmod=pikera" alone doesn't help, please follow the suggestion from [pamarac](#) and install Catalina with the RX5700 XT disconnected and the other EFI folder:

## Zitat von pamarac

Unplug your graphics cards and connect your monitor directly to the motherboard.

Use the very first file from post 1 (nur-iGPU) for the installation. After the installation completes you can plug back the 5700XT und copy the EFI you want to your system drive.

As described, after the installation is finished use the iMacPro1,1 EFI folder and put the 5700XT back in. Do this before you connect your computer to iCloud.

[karacho](#) Ah, alles klar, danke! Jetzt versteh ich's auch 😊
