And what about Video Decoding and Encoding after sleep? Did you manage to fix this as well?

Sorry for the late reply.. No, for me sleep is not working at all. If i try to activate sleep my machine restarts. Happened the same to all of my hackintoshes in the past regardless it had ME or the ME was hidden just like in this mini pc, so I only use Lock Screen when I leave the computer and I completely disabled sleep and hibernation. Other than sleep the machine is rock stable...
