## **Vorke V8 Mini PC (i7-8750H): IGPU will nicht**

**Beitrag von „thexsenator“ vom 6. Dezember 2019, 14:21**

I did verify it with terminal commands... sudo nvram StormTestVar=MyTest then reboot. After bootup StormTestVar remains in the nvram so it seems it is working, also iMessage works, and I don't have EmuVariableUefi installed. Here are my pm settings pmset -g (womp is enabled because I had strange ethernet dropouts in the past few weeks... trying to narrow down the cause...):

Currently in use:

standby 1

Sleep On Power Button 1

womp 1

autorestart 0

hibernatefile /var/vm/sleepimage

proximitywake 1

powernap 0

gpuswitch 2

networkoversleep 0

disksleep 0

standbydelayhigh 86400

sleep 0

hibernatemode 3

ttyskeepawake 1

displaysleep 60

tcpkeepalive 1

highstandbythreshold 50

standbydelaylow 86400
