Wozu wird dieses Sicherheitsrisiko eingebaut, welche Vorteile kann das haben?

Zitat

Authenticated restart is a way to reboot FileVault 2 enabled macOS without entering the password. To perform authenticated restart one can use a dedicated terminal command: "sudo fdesetup authrestart". It is also used when installing operating system updates.

VirtualSMC performs authenticated restart by saving disk encryption key split in NVRAM and RTC, which despite being removed as soon as OpenCore starts, may be considered a security risk and thus is optional.
